

c37.TumorBoard

with VideoConference

teamwork for the patient

Tumor boards efficiently organized: integrating video, IHE and radiological imaging (PACS)

Organizing interdisciplinary tumor conferences in well structured web based c37.TumorBoard

- For the presenting of cases casemanager use already existing data from HIS and supplements specifically for the need of the current issue.
- External partners may register patients to the conference via c37.Conjoint-Board software tool. In the invitation to the conference all participants receive an agenda highlighting the key issues.
- When the conference begins those participants not physically present can be added virtually via the CISCO Videoconference system. This is a highly professional solution – giving the impression of almost as present in person.
- During discussions images and radiological & lab reports are in direct access via interfacing to HIS and clinical subsystems.
- Decisions are to be documented with a simple few mouse clicks. At the end of the conference protocol is already ready to be emailed or printed.

c37.TumorBoard truly controls all relevant activities pre and during the case conference efficiently for the sake of all professionals involved and for the sake of the patient as well !
